

AV Market Share Trajectories

Full 30-year penetration path by policy scenario

AV Penetration Heatmap

Share of fleet that is autonomous — every 2 years

Fleet Composition Over Time

Total vehicle stock split between autonomous and conventional

Demand vs. Actual Adoption Rate

Gap between what consumers want and what the supply chain delivers

Time-Varying Policy Controls
How each dynamic policy adjusts its levers over the 30-year horizon

Distribution of AV Market Share Outcomes

Density of 100 Monte Carlo simulations at years 10, 20, and 30

Parameter Sensitivity — Swing Analysis

Change in final AV share when parameter varies $\pm 50\%$ from baseline

Phase Portrait: Infrastructure vs. AV Adoption

Trajectory through state space — circle = start, triangle = year 30

- No Policy
- Aggressive
- Phaseout
- Adaptive
- High Rebates
- Moderate Rebate
- Ramp-Up
- Front-Loaded
- Infra Focus
- Supply Push
- Pulse

Cumulative Policy Expenditure

Total government spend on rebates + infrastructure over time

Cumulative Spend per Autonomous Vehicle

Total policy dollars spent divided by AV fleet size — policy efficiency metric

Figure SSM-1: OLS Calibration Fit
Observed vs. fitted log-odds across 53 penetration estimates (4 sources)

$R^2 = 0.91$
Residual SE = 0.29 log-odds

Observed Log-Odds of Adoption

- Goldman Sachs
- Morgan Stanley
- VTPI
- WEF

$$\hat{\beta}_0 + \hat{\beta}_1(r/P_{AV}) + \hat{\beta}_2\tilde{I}$$

Figure SSM-2: Sensitivity Tornado Chart

Year-30 AV share range when each parameter varies $\pm 20\%$; baseline marked

Figure SSM-3: AV Fleet Adoption Trajectories with Monte Carlo Uncertainty Bands

Solid lines = deterministic scenario; shaded = 10th–90th percentile of 100 MC runs

Figure SSM-4: Logistic Adoption Surface

Predicted adoption fraction across policy levers; * = scenario operating points at Year 15
